# WEEK 8

# **Experiments based on Dictionary and its Operations**

A sentence is a string of single-space separated words where each word consists only of lowercase letters. A word is uncommon if it appears exactly once in one of the sentences, and does not appear in the other sentence.

Given two sentences s1 and s2, return a list of all the uncommon words. You may return the answer in any order.

```
Example 1:
```

Input: s1 = "this apple is sweet", s2 = "this apple is sour"

Output: ["sweet","sour"]

Example 2:

Input: s1 = "apple apple", s2 = "banana"

Output: ["banana"]

Constraints:

1 <= s1.length, s2.length <= 200

s1 and s2 consist of lowercase English letters and spaces.

s1 and s2 do not have leading or trailing spaces.

All the words in s1 and s2 are separated by a single space.

Note:

Use dictionary to solve the problem

#### For example:

Input	Result
this apple is sweet this apple is sour	sweet sour

Answer:(penalty regime: 0 %)

```
def uncommon_words(s1, s2):
    words1 = s1.split()
    words2 = s2.split()
    word_count = {}

    for word in words1:
        word_count[word] = word_count.get(word, 0) + 1

    for word in words2:
        word_count[word] = word_count.get(word, 0) + 1
    uncommon = [word for word, count in word_count.items() if count == 1]
    return uncommon
```

```
def main():
    s1 = input().strip()
    s2 = input().strip()

    result = uncommon_words(s1, s2)
    print(" ".join(result))
if __name__ == "__main__":
    main()
```

Input	Expected	Got
this apple is sweet this apple is sour	sweet sour	sweet sour
apple apple banana	banana	banana

#### Passed all tests!

Correct

Marks for this submission: 1.00/1.00.

Question **2**Correct
Mark 1.00 out of 1.00

Flag question

#### **Ouestion text**

Create a student dictionary for n students with the student name as key and their test mark assignment mark and lab mark as values. Do the following computations and display the result.

- 1. Identify the student with the highest average score
- 2. Identify the student who as the highest Assignment marks
- 3. Identify the student with the Lowest lab marks
- 4. Identify the student with the lowest average score

Note:

If more than one student has the same score display all the student names

Sample input:

4

James 67 89 56

Lalith 89 45 45

Ram 89 89 89

Sita 70 70 70

Sample Output:

Ram

```
James Ram
Lalith
Lalith
```

## For example:

Input	Result
4 James 67 89 56 Lalith 89 45 45 Ram 89 89 89 Sita 70 70 70	Ram James Ram Lalith Lalith

Answer:(penalty regime: 0 %)

```
def average(scores):
    return sum(scores) / len(scores)
n = int(input())
students = {}
for _ in range(n):
    name, test, assignment, lab = input().split()
    students[name] = [int(test), int(assignment), int(lab)]
averages = {name: average(scores) for name, scores in students.items()}
highest_avg = max(averages.values())
highest avg students = [name for name, avg in averages.items() if avg ==
highest_avg]
highest_assignment = max(student[1] for student in students.values())
highest_assignment_students = [name for name, scores in students.items() if
scores[1] == highest_assignment]
lowest_lab = min(student[2] for student in students.values())
lowest_lab_students = [name for name, scores in students.items() if scores[2]
== lowest lab]
lowest_avg = min(averages.values())
lowest_avg_students = [name for name, avg in averages.items() if avg ==
lowest_avg]
print("\n".join([
    " ".join(sorted(highest_avg_students)),
    " ".join(sorted(highest_assignment_students)),
    " ".join(sorted(lowest_lab_students)),
    " ".join(sorted(lowest_avg_students))
]))
```

Input	Expected	Got	
4 James 67 89 56 Lalith 89 45 45 Ram 89 89 89 Sita 70 70 70	Ram James Ram Lalith Lalith	Ram James Ram Lalith Lalith	
3 Raja 95 67 90 Aarav 89 90 90 Shadhana 95 95 91	Shadhana Shadhana Aarav Raja Raja	Shadhana Shadhana Aarav Raja Raja	

#### Passed all tests!

Correct

Marks for this submission: 1.00/1.00.

Question **3**Correct
Mark 1.00 out of 1.00

Flag question

#### Question text

Given an array of names of candidates in an election. A candidate name in the array represents a vote cast to the candidate. Print the name of candidates received Max vote. If there is tie, print a lexicographically smaller name.

## **Examples:**

Output: John

We have four Candidates with name as 'John', 'Johnny', 'jamie', 'jackie'. The candidates John and Johny get maximum votes. Since John is alphabetically smaller, we print it. Use dictionary to solve the above problem

# Sample Input:

10

John

John

Johny

Jamie

Jamie

Johny

```
Jack
Johny
Johny
Jackie
Sample Output:
Johny
Answer:(penalty regime: 0 %)
def find_winner(votes):
   vote_count = {}
    for candidate in votes:
        vote_count[candidate] = vote_count.get(candidate, 0) + 1
   max_votes = max(vote_count.values())
   winners = [candidate for candidate, votes in vote_count.items() if votes
== max_votes]
    return min(winners)
def main():
   n = int(input())
   votes = [input().strip() for _ in range(n)]
   winner = find_winner(votes)
   print(winner)
main()
```

Input	Expected	Got	
10 John Johny Jamie Jamie Johny	Johny	Johny	

Input	Expected	Got	
Jack Johny Johny Jackie			
6 Ida Ida Ida Kiruba Kiruba Kiruba	Ida	Ida	

Passed all tests!

Correct

Marks for this submission: 1.00/1.00.

Question **4**Correct

Mark 1.00 out of 1.00

Flag question

#### Question text

In the game of Scrabble™, each letter has points associated with it. The total score of a word is the sum of the scores of its letters. More common letters are worth fewer points while less common letters are worth more points. The points associated with each letter are shown below:

**Points Letters** 

1 A, E, I, L, N, O, R, S, T and U

2 D and G

3 B, C, M and P

4 F, H, V, W and Y

5 K

8 J and X

10 Q and Z

Write a program that computes and displays the Scrabble™ score for a word. Create a dictionary that maps from letters to point values. Then use the dictionary to compute the score.

A Scrabble™ board includes some squares that multiply the value of a letter or the value of an entire word. We will ignore these squares in this exercise.

Sample Input

REC

Sample Output

REC is worth 5 points.

## For example:

Input	Result	
REC	REC is worth 5 points.	

Answer:(penalty regime: 0 %)

```
def calculate_scrabble_score(word):
    letter_points = {
        'A': 1, 'E': 1, 'I': 1, 'L': 1, 'N': 1, '0': 1, 'R': 1, 'S': 1, 'T':
1, 'U': 1,
        'D': 2, 'G': 2,
        'B': 3, 'C': 3, 'M': 3, 'P': 3,
        'F': 4, 'H': 4, 'V': 4, 'W': 4, 'Y': 4,
        'K': 5,
        'J': 8, 'X': 8,
        'Q': 10, 'Z': 10
    }
    score = sum(letter_points.get(letter.upper(), 0) for letter in word)
    return score
def main():
   word = input().strip()
    score = calculate_scrabble_score(word)
    print(f"{word} is worth {score} points.")
main()
```

Input	Expected	Got
GOD	GOD is worth 5 points.	GOD is worth 5 points.
REC	REC is worth 5 points.	REC is worth 5 points.

Passed all tests!

Correct

Marks for this submission: 1.00/1.00.

Question **5**Correct

Mark 1.00 out of 1.00

#### Question text

Give a dictionary with value lists, sort the keys by summation of values in value list.

**Input**: test\_dict = {'Gfg' : [6, 7, 4], 'best' : [7, 6, 5]}

Output : {'Gfg': 17, 'best': 18}

```
Explanation: Sorted by sum, and replaced.
Input: test_dict = {'Gfg': [8,8], 'best': [5,5]}
Output: {'best': 10, 'Gfg': 16}
Explanation: Sorted by sum, and replaced.
Sample Input:
2
Gfg 6 7 4
Best 7 6 5
Sample Output
Gfg 17
```

# For example:

Best 18

Input	Result
2 Gfg 6 7 4 Best 7 6 5	Gfg 17 Best 18

Answer:(penalty regime: 0 %)

```
num_entries = int(input())
test_dict = {}
for _ in range(num_entries):
    key, *values = input().split()
    test_dict[key] = sum(map(int, values))
sorted_dict = dict(sorted(test_dict.items(), key=lambda item: item[1]))
for key, value in sorted_dict.items():
    print(key, value)
```

Input	Expected	Got	
2 Gfg 6 7 4 Best 7 6 5	Gfg 17 Best 18	Gfg 17 Best 18	
2 Gfg 6 6 Best 5 5	Best 10 Gfg 12	Best 10 Gfg 12	

#### Passed all tests!

Correct

Marks for this submission: 1.00/1.00.
